Primer sets for synthesizing polynucleotides, particularly the 5602 full length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length

Claim 8; SEQ ID NO 17352; 2537pp + Sequence Listing; English.

The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end

12-DEC-2002

```
sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises a 3'-end sequence, where the oligonucleotide comprises at 3'-end sequence, where the combination of the 5'-end sequence is nucleotides and the combination of specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs asily without any specialised methods. AAH03166 to AAH13628 and AAH13631 to AAH18472 represent human cDNA sequences; AAB2446 c AAB95893 represent human amino acid sequences; and AAH13629 to AAB413632 represent oligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                         ô

RESULT
```

181

WO200299122-A1

```
The invention relates to identifying (Mi) a candidate ps; pathway modulating agent, by contacting an assay system comprising a purified HW modulating agent, by contacting an assay system conditions, where but Drosophila) or nucleic acid with a test agent under conditions, where but Cor the presence of the test agent. The system provides a reference activity, and detecting a test agent. Diased activity of the assay system. Also included are modulating (M2) a p53 pathway of a cell (comprising contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HW polypeptide comprising an HW amino acid sequence, where p53 function is restored), modulating (M3) a p53 pathway of a cell (comprising contacting the cell with an agent that specifically binds an HW polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising; (a) obtaining a biological sample of from the patient; (b) contacting the sample with a probe for HW expression, (c) comparison indicates a likelihood disease). (M1) is useful cor identifying modulators of the p53 pathway, a probe for HW expression for is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where disease or disease or disarder prognosis is related the patient of modulating the p53 pathway of a cell, thus restoring the p53 pathway such as angiogenese normal cor also useful for reating defects in the p53 pathway such as angiogenic, also useful for treating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, also useful for reating defects in the p53 pathway such as angiogenic, approttic or cell profileration disorders. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The present invention describes a predictor set comprising a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of cells, determining whether the cells express a plurality of markers and correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for identifying polymucleotides and polypeptides whose expression levels correlate with compound sensitivity or resistance of cells associated with a disease state; and (3) identifying polymucleotides and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             407
expression pattern of the microarray. The polynucleotides and polypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining and sensitivity in patients to allow the development of individualized genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ovarian antigen; ovary, ovarian; breast, cancer; tumour; ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCGS; ovarian cyst; dysmenorinoea; endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; infection; cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective;

                                                                                                                                       В
                                                                                                                                                                     ò
                                                  à
                                                                                                                                                                                                                                                                                                                                                        The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polybrucleotides 93% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen corrections and host cells comprising human ovarian antigen polymucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and metastatic tunnurs of ovarian or breast origin, reproductive system disorders (e.g., inflating or preventing various ovary and/or breast-related disorders, inflating covarian cysts, and dysmenorthoea), endocrine disorders, inflating or preventing various, anovulation, polycystic ovary syndrome; ovarian cysts, and dysmenorthoea, endocrine disorders, inflating or congenital and acquired cancer, and used manually inflating ophoritis and various or vaginitis), immune disorders (e.g., congenital and acquired condeficiencies, autoimmune ophoritis, systemic lupus erythematosus), clood-related disorders (e.g., anaemia), cardiovascular disorders condulate ovarian antigen polypeptides and ophoritis and polypeptides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polynucleotides may be used as food additives or to prepare antibodies claence data for this parent did not form part of the printed sequence represents a human ovarian antigen of the invention. Note: The specification, but was obtained in electronic format directly from MIPO contractly directly from WIPO contractly directly from wiponed and discorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7
                                                                                                                                                                                                                                               Isolated nucleic acid molecules encoding novel ovarian polypeptides, useful in the prevention, treatment and diagnosis of cancer (e.g. ovarian cancer), immune disorders, cardiovascular disorders and neurological diseases.

```

The invention relates to an isolated human disease detection and treatment (MDDT) polypeptide (1) selected from a polypeptide having a sequence selected from 254 sequences (ABP51211-ABP51464) given in the specification, a naturally occurring polypeptide comprising a sequence having at least 90% identity to (1) or a biologically active or naturally occurring polypeptide comprising a sequence compound for effectiveness as an agonist or antagonist, for screening a compound for effectiveness as an agonist or antagonist, for screening a compound for preparing a polyclonal or monoclonal antibody by hybridoma technology.

The specifically binds (1) or modulates the activity of (1), and for consequence of the compound for effectiveness in altering expression of a target compound for effectiveness in altering expression of a target polynucleotide comprising. Oligonucleotides and antibodies are useful for detecting MDDT in a sample or for assessing toxicity of a test compound, in a diagnostic test for a condition or a disease associated with the expression of MDDT in a biological sample, for detecting (1) in a sample, and for purifying (1) from a sample. Accordated with decreased or increased expression of functional MDDT. (1) or (11) are useful for diagnosing, treating a disease or condition associated with aberrant expression of MDDT, where the disorders are cirrhosis, hepatitis for diagnosing, treating or preventing disorders are selected from a cell proliferative disorder such as arteriosclerosis, cirrhosis, hepatitis, poliferative disorder such as arteriosclerosis or theumatoid arthritis. (11) are useful for creating sore, in somethic or entering a cutoimmune/inflammatore and an expression of functional moder and an entering arthritis. (11) are useful for creating sore, in some or condition of the property in a standard in a transpense or condition or animals or transgenic entering a transcenic expression of animals or preservent or such a transcent or a transcent or property in a transcent or a transcent or a trans germline gene therapy, to generate a transcript image of a tissue or cell type, for detecting differences in the chromosomal location due to translocation or inversion among normal, carrier or affected individuals and as hybridisation probes for mapping naturally occurring genomic sednences

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). (II) elementary production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations in diagnostics. Gorensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WHOO at the printed specification, but was obtained in electronic format directly from WHOO at the printed specification.

                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                9
                                                                                                                                                                                                                                                                                                                                                                                                               96
                                                        The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS-137-ABB72072). The sequence data for this parent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AAO00010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerical polymerical are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or e.g. stem cell growth factor activity, immunomodulatory activities, activity, issue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, architis and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                       Human, cytokine, cell proliferation, cell differentiation, gene therapy, vaccine, peptide therapy, stem cell growth factor; haematopolesis; tissue growth factor; immunomodulatory; cancer; leukaemia; nervous system disorders; arthritis; inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 20; SEQ ID NO 18277; 1399pp + Sequence Listing; English.
                 Human polypeptide SEQ ID NO 18277.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGK) primers, and for chomosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites apprehens to protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this patient did not appear in the printed specification, but was obtained in electronic format directly from WINPO at the printed specification, but was obtained in electronic format directly from WINPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           310 PALDVDWQSNNTFASCSTDMCIHVCKLGQDRPIKTFQGHTNEVNAIKWDPTGNLLASCSD

Proteins of the invention and DNA sequences encoding them are given in records ABR52568-ABR53903 and ACC6610-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office. The complete document is available on CD-ROM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .07 QAAAAAAAAAAASQQGSAKNGENTANGEENGAHTIANNHTDMMEVDGDVEIPPNKAVVLR 166

```

```
The invention relates to 45 human intracellular signalling molecules (INNSIG), INTSIG-1 to INTSIG-45, and the cDNAs encoding them (ADA13319-CC ADA13408). The invention also encompasses expression constructs, host cells and transgenic organisms comprising an INTSIG nucleic acid sequence; the recombinant preparation of a INTSIG, an antibody against a INTSIG, methods of detection of INTSIG proteins or nucleic acids; an antibody against a INTSIG; containing INTSIG nucleic acids, methods of screening compounds for their acids or compositions comprising an INTSIG protein, and pharmaceutical compositions comprising them are useful in diagnosing, treating or compositions comprising them are useful in diagnosing, treating or preventing a variety of disorders, including cell profilerative disorders (e.g., AIDS, allergies, anaemia, asthma, bronchitis, gout, multiple compositions cancer or atherosclerosis); autoimmune/inflammatory disorders (e.g., AIDS, allergies, anaemia, asthma, bronchitis, gout, multiple corporations, parasitic, protozoan or helminthic infections; neurological disorders (e.g., epilepsy, stroke, Alzheimer's disease); developmental disorders (e.g., achondroplastic comparations disease); developmental disorders (e.g., achondroplastic comparations); neurological disorders (e.g., achondroplastic comparations); neurological disorders (e.g., achondroplastic comparations); neurological disorders (e.g., achondroplastic comparations); reproductive disorders (e.g., achondroplastic comparations); reproductive disorders or the hypothalamus or pituitary gland or comparations or planes or parkinson's disease, dementia, or the present sequence comparation of the hypothalamus or pituitary gland or comparation of the invention or help present sequence comparations of the present sequence comparation of the invention or the present sequence contains the present sequence contains the present sequence contains the present sequence contains an invention of the present sequence contains an invention of the present sequence co
diagnosing, treating and preventing diseases or conditions associated with the aberrant INTSIG expression e.g. cancer, diabetes, epilepsy, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              represents an INTSIG protein of the invention.

Drosophila melanogaster polypeptide SEQ ID NO 13572

SAKNGENTANGEENGAHTIANNHTDMMEVDGDVEIPPNKAVVLRGHESEVFICAWNPVSD 182 LMVSASEDATIRIWDFETGEYERSLKGHTDSV-----QDVA-----FDAQGK 163 TGEAKQQFPFHSAPALDVDWQSNNTFASCSTDMCIHVCKLGQDRPIKTFQGHTNBVNAIK 356 PNAN---LMLASASFDSTVRLWDVDRGICIHTLTKHQEPVYSVAFSPDGRYLASGSFDKC 465 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences |:: |:||:||:|| |::|

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a TZap protein. The TZap gene is involved in T cell activation, and in the modulation of immune responses. TZap polynucleotides and polypeptides are useful for disposants or treating acute and chronic diseases involving T cell activation and Thl and TLD immune response, for the treatment of acute and chronic rejection of alloand xeno organ transplants and home marrow transplantation, for the treatment of Theumatoid arthritis, lupus erythematosis, multiple sclerosis, encephalitis, vasculitis, diabetes mellitus, multiple sclerosis, encephalitis, thyroiditis, for the treatment of malignant disorders of T, B or NK cells, for the treatment of malignant Helicobacter pylori associated gastritis or for the treatment of skin tumours, adrenal tumours or lung tumours, wound healing, growth disorders

The present invention describes primer sets for synthesising 5602 full-
length CDMAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligounclectide complementary to the complementary strand of a polynuclectide which comprises one of the 5602 nucleotide sequences defined in the specification, where the onligounclectide comprises at least 15 nucleotides; or. (b) a combination of an oligonuclectide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to a polynucleotide which comprises a 1'-end sequence of proportions and the comprises at least 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence, where the oligonucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence 3'-end sequence; where the repay and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDMAs. The primers are also useful for the cetection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDMAs. The primers are also useful for the cetection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDMAs. The primers allow obtaining of the full-length cDMAs easily without any specialised methods. AAH1362s and AAH13613 represent human amino acid sequences, and AAH1362 to AAH1362s represent human amino acid sequences, and AAH1362 to AAH13612 represent complements and used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             170 KLASGCKNGQILLWDPSTGKQVGRTLAGHSKWITGLSWEPLHANPECRYVASSSKDGSVR 229

SwissProt\_42:\* Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nature 370:16-218 (1994)

-!- FUNCTION: Probably involved in nuclear migration during cell division. Participates in the process of neuronal cell division. Participates in the process of neuronal cell division. Participates in the process of neurons. May participate in nuclear migration of differentiating neurons. May participate in targeting cytoplasmic dyrein to the microtubule plus ends, thereby playing an essential role in dynein-mediated microtubule sliding. Non-catalytic subunit of a acetylhydrolase complex, a complex that inactivates platelet-activating factor (PAF) by removing the acetyl group at the SN-2 position (By similarity).

-!- SUBUNIT: Cytoslic PAF-AH IB is formed of three subunits of 45 kDa of the enzyme resides in the beta and gamma subunits of 45 kDa of the enzyme resides in the beta and gamma subunits, whereas the alpha subunit has regulatory activity. Interacts with dynein and dynactin. Interacts with RSN (By similarity).

-!- SUBCELULAR LOCATION: Cytoplasmic; localizes to the plus end of microtubules (By similarity).

-!- SIMILARITY: Contains 7 WD repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EMBL; D30615; BAA06305.1; -.
